In this sense it is regularly applied to the ancient historical church, its faith and organization down to the time of the great schism between the sees of Rome and Constantinople: as, a *Catholic* bishop or synod, as distinguished from a Nestorian or Jacobite prelate or council.

The importunity of heretics made them [the Church of Christ] add another name to this [Christian], viz., that of *catholic*; which was, as it were, their surname or characteristic, to distinguish them from all sects, who, though they had party names, yet sometimes sheltered themselves under the common name of Christians.
Bingham, Antiq., I. i. § 7.

The test of *Catholic* doctrine, the maintenance of which distinguishes the *Catholic* Church in any place from heretical or schismatical communions, has been described as that which has been taught always, everywhere, by all.

In this sense the word *Catholic* is applied by Anglican writers to their own communion. (*e*) [*cap.*] Claiming to possess exclusively the notes or characteristics of the one, only, true, and universal church—unity, visibility, indefectibility, succession, universality, and sanctity: used in this sense, with these qualifications, only by the Church of Rome, as applicable only to itself and its adherents, and to their faith and organization; often qualified, especially by those not acknowledging these claims, by prefixing the word *Roman*. (*f*) More specifically, an epithet distinguishing the faith of the universal Christian church from those opinions which are peculiar to special sects. (*b*) A reform party in the Roman Catholic Church, founded after the proclamation of, and in opposition to, the dogma of papal infallibility proclaimed by the Vatican Council in 1870. A schism with the Roman Catholic Church was not intended, but it resulted; the leaders were excommunicated and new congregations formed. No bishop having joined the movement, the ordination of a bishop was obtained from the Old Catholic bishop of Deventer in Holland. Old Catholics have departed in few respects from their former ecclesiastical customs as Roman Catholics. caucus (kâ'kus), *n.* [This word originated in Boston, Massachusetts. According to a common account it is a corruption of *calkers' meeting*, a term said to have been applied in derision by the Tories to meetings of citizens, among whom were calkers and ropemakers, held to protest against the aggressions of the royal troops, and especially against the "Boston Massacre" of March 5th, 1770. But such a corruption and forgetfulness of the orig. meaning of a word so familiar as *calkers* is improbable, and, moreover, the word *caucus* occurs at least 7 years earlier, in the following passage in the diary of John Adams: "Feb. . . . , 1763—This day learned that the *Caucus* Club meets at certain times in the garret of Tom Dawes, the adjutant of the Boston (militia) regiment." This indicates the origin of the term *caucus*, as a private meeting for political purposes, in the name of a club of that nature, called the "Caucus Club." A club is mentioned in 1760 as "the New and Grand *Corcas*," in distinction from "the old and true Corcas" (Boston-Gazette and Country Journal, suppl., May 5, 1760). The name is prob. Algonkin, answering to the Virginian form *caw-cawwassough*, mentioned by Captain John Smith (Wks., repr. 1884, pp. 51 and 347) as the name of the "Elders" of the "Chickhamanians" or "Chickahamanians" of Virginia (cf. *cockarouse*).] **1.** In *U. (*b*) A similar congressional, legislative, or other gathering of leading members of a party for conference as to party measures and policy. Candidates for the presidency and vice-presidency of the United States were nominated by party caucuses of members of Congress from 1800 to 1824.

It. *causa*, *cosa* = Pg. *causa*, *cousa*, *coisa*, < L. *causa*, also spelled *caussa*, a cause, reason, in ML. also a thing; origin uncertain. See *accuse*, *excuse*.] **1.** That by the power of which an event or thing is; a principle from which an effect arises; that upon which something depends per se; in general, anything which stands to something else in a real relation analogous to the mental relation of the antecedent to the consequent of a conditional proposition. Nominalist philosophers commonly hold that every effect is the result not of one but of many causes (see *total cause*, below); but the usual doctrine is that the effect is an abstract element of a thing or event, while the cause is an abstract element of an antecedent event. Four kinds of causes are recognized by Aristotelians: the *material*, *formal*, *efficient*, and *final cause*. *Material cause* is that which gives being to the thing, the matter by the determination of which it is constituted; *formal cause*, that which gives the thing its characteristics, the form or determination by which the matter becomes the thing; *efficient cause*, an external cause preceding its effect in time, and distinguished from *material* and *formal cause* by being external to that which it causes, and from the end or *final cause* in being that by which something is made or done, and not merely that for the sake of which it is made or done; *final cause*, an external cause following after that which it determines (called the *means*), the end for which the effect exists. Other divisions of causes are as follows: *subordinate* or *second cause*, one which is itself caused by something else; *first cause*, that which is not caused by anything else; *proximate* or *immediate cause*, one between which and the effect no other cause intervenes, or, in *law*, that from which the effect might be expected to follow without the concurrence of any unusual circumstances; *remote cause*, the opposite of *proximate cause*; *total cause*, the aggregate of all the antecedents which suffice to bring about the event; *partial cause*, something which tends to bring about an effect, but only in conjunction with other causes; *emanative cause*, that which by its mere existence determines the effect; *active cause*, that which brings about the effect by an action or operation, termed the *causation*; *immanent cause*, that which brings about some effect within itself, as the mind calling up an image; *transient cause*, that whose effect lies outside itself; *free cause*, that which is self-determined and free to act or not act: opposed to *necessary cause*; *principal cause*, that upon which the effect mainly depends; *instrumental cause*, a cause subservient to the principal cause. The above are the chief distinctions of the Aristotelians. The physicians, following Galen, recognized three kinds of causes, the *procatarctic*, *proëgumenal*, and *synectic*. The *procatarctic cause* is an antecedent condition of things outside of the principal cause, facilitating the production of the effect; the *proëgumenal cause* is that within the principal cause which either predisposes or directly excites it to action; and the *synectic*, *containing*, or *continent cause* is the essence of the disease itself considered as the cause of the symptoms; thus typhoid fever might be referred to as the *continent cause* of ocher-stools or a quickened pulse. Other varieties are the *occasional cause* (see *occasionalism*); *moral cause*, the person inciting the agent to action; *objective cause*, the ideas which excite the imagination of the agent; and *sufficient cause*, one which suffices to bring about the effect (see *sufficient reason*, under *reason*).

In virtue of his character as knowing, therefore, we are entitled to say that man is, according to a certain well-defined meaning of the term, a free *cause*.
T. H. Green, Prolegomena to Ethics, § 74.

Cause is the condensed expression of the factors of any phenomenon, the effect being the fact itself.
G. H. Lewes, Probs. of Life and Mind, II. v. § 19.

Of these two senses of the word *cause*, viz., that which brings a thing to be, and that on which a thing under given circumstances follows, the former is that of which our experience is the earlier and more intimate, being suggested to us by our consciousness of willing and doing.
J. H. Newman, Gram. of Assent, p. 65.

Specifically—**2.** An antecedent upon which an effect follows according to a law of nature; an efficient cause. The common conception of a cause, as producing an effect similar to itself at a later time and without essential reference to any third factor, is at variance with the established principles of mechanics. Two successive positions of a system must be known, in addition to the law of the force, before a position can be predicted; but the common idea of a cause is that of a single antecedent determining a consequent of the same nature. Moreover, the action of a force is strictly contemporaneous with it and comes to an end with it; and no known law of nature coördinates events separated by an interval of time.

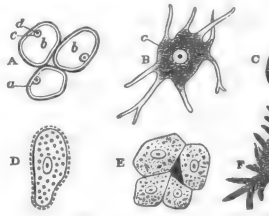
4. In *arch.* See *cella*, 1.—**5.** In *biol.*: (*a*) The fundamental form-element of every organized body. It is a bioplastic mass of protoplasm, varying in size and shape, generally of microscopic dimensions, capable under proper conditions of performing the functions of sensation, nutrition, reproduction, and automatic or spontaneous motion, and constituting in itself an entire organism, or being capable of entering into the structure of one. Such a cell as a rule has a nucleus, and is usually also provided with a wall or definite boundary; but neither cell-nucleus nor cell-wall necessarily enters into its structure. In ultimate morphological analysis, all organized tissue is resolvable into cells or cell-products. See *protoplasm*, and *cell theory*, below. (*b*) Specifically, a nucleated capsulated form-element of any structure or tissue; one of the independent protoplasmic bodies which build up an animal fabric; a body consisting of cell-substance, cell-wall, and cell-nucleus: as, bone-*cells*, cartilage-*cells*, muscle-*cells*, nerve-*cells*, fat-*cells*, *cells* of connective tissue, of mucous and serous membrane, etc., of the blood, lymph, etc. This is the usual character of cells in animals, and is the ordinary technical anatomical sense of the word.



Cells.

A, a few cells from the chorda dorsalis of the lamprey: *a*, cell-wall; *b*, cell-contents; *c*, nucleus; *d*, nucleolus. *B*, multipolar nerve-cell (with many processes) from human spinal cord: *c*, nucleus and nucleolus. *C*, an oval nerve-cell. *D*, cartilage-cell. *E*, hepatic or liver cells. *F*, pigmentary cell, from skin of frog. (All magnified.)

If a single *cell*, under appropriate conditions, becomes a man in the space of a few years, there can surely be no difficulty in understanding how, under appropriate conditions, a *cell* may in the course of untold millions of years give origin to the human race. *H. Spencer*, Prin. of Biol., § 118.

However complicated one of the higher animals or plants may be, it begins its separate existence under the form of a nucleated *cell.* *Huxley*, Anat. Invert., p. 19.

See cuts under *Plumatella* and *Polyzoa.*—**6.** In *anat.* and *zoöl.*, some little cavity, compartment, camera, or hollow place; a cella or cellula; a vesicle; a capsule; a follicle; a corpuscle, etc.: as, the *cells* of honeycomb; the *cells* (not osteoblasts) of cancellous bone-tissue; the *cells* (compartments, not form-elements) of cellular or connective tissue; the *cells*, or cancelli, of the reticulated structure of an insect's wing (that is, the spaces between the nervures or veins); the *cells* of a foraminiferous or radiolarian shell; the *cells* (ventricles, cavities) of the brain; specifically, in *entom.*, the basal inclosed space of the wing of a lepidopterous insect, bounded by the subcostal and median veins, which are joined exteriorly.—**7.** A division of the brain as the seat or abode of a particular faculty. [Poetical.]

Chaucer, Knight's Tale, l. 518.

Mine eyes he closed, but open left the *cell*
Of fancy, my internal sight. *Milton*, P. L., viii. 469.

8. In *elect.*, a single jar or element of a voltaic battery. A *simple cell* ordinarily consists of plates of two different metals joined by a wire and immersed in a liquid (called the exciting liquid) which acts chemically upon one plate; this, the positive or generating plate, at the expense of which the electrical current is maintained, is usually zinc; the negative plate is often copper, but may be platinum, carbon, silver, etc. The exciting liquid is commonly dilute sulphuric acid, but solutions of sal ammoniac, common salt, etc., are also used. The current flows through the liquid from the positive plate (zinc) to the copper, and through the wire from the positive pole to the negative pole. (See figure.) The current from a simple voltaic cell soon loses its strength, because hydrogen bubbles, liberated in the chemical action on the negative plate, form a film over it. This polarization of the negative plate (see *polarization*) may be partially avoided by mechanical means in a *single-fluid cell*, by using platinum, or silver covered with finely divided platinum, as in the *Smee cell*, or platinized carbon, as in the *Walker cell.* It is more effectually prevented in a *two-fluid cell* by the addition of a second liquid (the depolarizing liquid), with which the hydrogen combines chemically. In the *Grenet cell*, or *bottle-cell*, bichromate of potash is mixed with the sulphuric acid (being hence called a *bichromate cell*) in a vessel of bottle form, and the zinc and carbon are immersed in them; the zinc, however, is raised out of the liquid when the cell is not in use. Practically, the depolarizing liquid is usually separated from the exciting liquid, as in the *compound cell.* One of the best of these is the *Daniell cell*, which consists of a zinc plate immersed in dilute sulphuric acid contained in a porous vessel, outside of which is a perforated copper plate surrounded by a solution of copper sulphate. The action is as follows; The reaction between the zinc and sulphuric acid produces zinc sulphate and hydrogen; the latter, however, instead of collecting on the copper plate, unites with the copper sulphate, forming sulphuric acid and metallic copper. The former goes to keep up the supply of acid in the inner vessel, and the latter is deposited on the copper plate. The consumption of copper sulphate is made good by a supply of crystals in a receptacle at the top. A modified form of the Daniell cell is the *gravity cell*, in which the porous vessel is done away with, and the two liquids are separated by their specific gravities; the copper sulphate surrounds the copper plate at the bottom, and the zinc sulphate the zinc plate at the top. This is the form of cell most used for telegraphic purposes in the United States. Other forms of the compound cell are the *Grove*, in which platinum and nitric

acid take the place of the copper and copper sulphate of the Daniell; the *Bunsen*, which is like the Grove except in the use of carbon instead of platinum; and there are many others. The *Leclanché cell*, much used in connection with electric call-bells (as also with the telephone), consists of a rod of zinc immersed in a solution of sal ammoniac, and a plate of carbon, sometimes, though not necessarily, in a separate porous vessel packed about with powdered manganese dioxid and carbon. This cell rapidly becomes polarized, but if left to itself soon regains its strength, and hence is especially valuable for intermittent use; it has also the advantage that there is no waste of the zinc by local action when not in use. The *silver-chlorid cell*, as devised by De la Rue, consists of zinc acted upon by sal ammoniac and a rod of silver surrounded by a cylinder of silver chlorid. The *Latimer-Clark standard cell* consists of zinc and pure mercury separated by a paste made from sulphates of zinc and mercury; when suitably arranged it maintains a very constant electromotive force, and hence has been used as a standard.

Its complete form, including the ovum as a simple cell also, is the basis of the present state of the biological sciences.—**Chalice-cells.** Same as *goblet-cells*.—**Collared cell,** a cell one end of which has a raised rim or border, like a collar, as that of a collar-bearing monad, or choanoflagellate infusorian.—**Condemned cell.** See *condemned*.—**Daughter-cell.** See *mother-cell*, below.—**Deiters's cells,** certain cells intimately connected with the external hair-cells of the cochlea; also, the cells of the neuroglia: sometimes applied to the large cells of the anterior cornua of the spinal cord, which give off Deiters's processes. The new cells are called *daughter-cells*.—**Peaucellier cell,** in *mech.*, a plane linkage discovered by Lieut. Peaucellier in 1864, which first solved the celebrated problem of parallel motion. It is composed of two long links of equal length, pivoted together at one end and at the other pivoted to the opposite angles of a rhombus composed of four equal and shorter links. For use, the junction, *A*, of the two long links is fixed in position, and an extra link, *BC*, is attached to the angle of the rhombus nearest to *A*. The other end, *B*, of the extra link is fixed in position, usually at a distance from *A* equal to *BC*. In this case, when *BC* turns about *B* as a center, the vertex, *E*, of the rhombus most distant from *A* will describe a right line. The production of this effect by link-work alone had been much sought after since the invention of the steam-engine.—**Principal cells,** the central cells of the cardiac glands of the stomach. Also called *adelomorphous cells*.—**Selenium cell.** See *resistance* and *photophone*.

cella (sel'ä), *n.*; pl. *cellæ* (-ē). [L.: see *cell*, *n.*] **1.** The room or chamber which formed the nucleus of an ancient Greek or Roman temple and contained the image of the deity, as distinguished from the additional rooms, porticos, etc., often combined with the cella to form the complete temple. The word is now often applied to the corresponding part of the temples of other peoples, as of the ancient Egyptians. Also *cell*.

The next class of temples, called pseudo-peripteral (or those in which the *cella* occupies the whole of the after part), are generally more modern, certainly more completely Roman, than these last. . . . But the finest specimen now remaining to us, the so-called Maison Carrée at Nîmes, which is indeed one of the most elegant temples of the Roman world, owing probably a great deal of its beauty to the taste of the Grecian colonists long settled in its neighborhood. It is hexastyle, with 11 columns in the flanks, 3 of which stand free and belong to the portico; the remaining 8 are attached to the walls of the *cella*.

The front of the *cella* includes a small open peristyle, with two composite Corinthian columns at the entrance, making, with those of the outer colonnade, eighteen columns standing.

cellulose[2] (sel′ū-lōs), *n.* and *a.* [⟨ *cellula* + *-ose.*]

I. *n.* In *bot.*, the essential constituent of the primary wall-membrane of all cells, a secretion from the contained protoplasm, isomerous with starch in its composition, and allied to starch, sugar, and inulin. It rarely or never exists in a simple condition unmixed with coloring or mineral matters, etc.; and with age it becomes largely transformed into lignin, suberin, or mucilage. Cotton and the bleached fiber of flax and hemp are nearly pure cellulose, and in some filter-paper it is almost chemically pure. Cellulose is remarkable for its insolubility, being dissolved without change only by an ammoniacal solution of oxid of copper, from which it may be again precipitated. Under the action of concentrated or boiling acids, or of caustic alkalis, many different products are obtained, according to the method of treatment. It is changed to glucose by long boiling with dilute sulphuric or hydrochloric acid; a substance resembling parchment is obtained by treating unsized paper with cold sulphuric acid; strong nitric acid, or a mixture of nitric and sulphuric acids, converts forms of cellulose into guncotton, etc. In its unchanged condition it is not colored by iodine except usually with a faint yellowish tint, which becomes a bright blue on the addition of strong sulphuric acid. Cellulose is also said to exist in the tunics of *Ascidia* and in other invertebrates.—**Starch-cellulose,** the delicate skeleton of cellulose which remains when starch-granules are dissolved in saliva or pepsin.

Formerly these peoples occupied, partly or wholly, France, Spain, northern Italy, the western parts of Germany, and the British islands. Of the remaining Celtic languages and peoples there are two chief divisions, viz., the *Gadhelic*, comprising the Highlanders of Scotland, the Irish, and the Manx, and the *Cymric*, comprising the Welsh and Bretons; the *Cornish*, of Cornwall, related to the latter, is only recently extinct.

celt[2] (selt), *n.* [ML. NL. *celtes*, celt.] In *archæol.*, an implement or weapon widely used among primitive and uncivilized races, and having the general form of a chisel or an ax-blade. In the eighteenth century the name was given to the stone and bronze implements of this general shape, without careful consideration of their probable uses. The stone celts are all of a form more or less closely resembling the head of a hatchet, differing only in being sometimes flatter and with a longer cutting edge, sometimes of a section nearly circular, pointed at one end, and coming abruptly to an edge at the other. The bronze celts, the forms of which are very varied, may be divided into three principal classes: First, chisel-shaped blades without sockets, but with raised rims on each side forming a pair of grooves, apparently intended to retain a wooden handle fitted on in the direction of the length of the blade; these may be considered as spades intended for agricultural labor. Second, chisel-shaped blades, having a deep socket at the end opposite the cutting edge, and usually fitted with a loop or pierced ear on one side. Third, blades, also with a socket, but shorter and broader; these, which have often been called ax-heads, are thought rather to be ferrules for the butt-end of spear-shafts and the like, the edge enabling them to be driven into the ground. See *amgarn, paalstab, pot-celt,* and *socket-celt.*

cement (sē-ment′ or sem′ent), *n.* [Early mod. E., and later also *ciment*, < ME. *ciment, cyment, syment*, < OF. *ciment, cement*, F. *ciment* = Pr. *cimen* = Sp. Pg. The noun is prop. pronounced, as being of ME. origin, sem′ent (formerly, in the spelling *ciment*, sim′ent); but the pron. sē-ment′, after the verb, is now more common.] **1.** Any composition which at one temperature or one degree of moisture is plastic and at another is tenacious. Cements are used for uniting materials of the same kind or of different kinds, or for forming smooth and impervious surfaces or coatings. The term properly includes papier-maché, gums, glues, mucilages, limes, mortars, and a great number of compounds of such nature as to admit of their assuming, under certain conditions, sticky, tenacious, or stone-like consistency. Cements are divided into classes, according to their use, as *glass-cement*, etc. The materials forming the cement are mixed with water, acids, oils, etc., to a paste, and applied to the surfaces to be joined together or coated, and then dried; or, either wet or dry, are applied hot, or are applied and then heated, when they become hard and tenacious. This hardening is called the "setting" of the cement. The cements in use in the arts are exceedingly numerous, and are composed of a great variety of materials.

Specifically—**2.** A kind of mortar which sets or hardens under water: hence often called *hydraulic cement*. It is, however, often used in superior masonwork not intended to be covered by water. There are two kinds of cement, *Portland* and *natural-rock* cement. Portland cement (named from its resemblance in color to Portland stone) is an artificial mixture, based on chemical analysis, of limestone and clay, or marl and chalk, shale and limestone, etc. Natural-rock cement is made from an argillaceous limestone which has the proper composition. In Europe cements are also made from volcanic ashes, and are called *trass* or *pozzuolana*. Much of the cement used in the United States is that known as *Rosendale*. See *cement-stone*.

3. A name sometimes given by placer and hydraulic miners to any rather firmly compacted mass of detrital auriferous material. Usually, however, the application of the word is limited to detrital material of volcanic origin, consisting of fragmentary substances mixed with ashes and caused to cohere somewhat firmly by pressure, or by silicious or calcareous matter.

4. In *anat.*, the cortical substance which forms the outer crust of a tooth from the point where the enamel terminates to the apex of the root, resembling bone in anatomical structure and chemical composition. Also called *cementum*. See cut under *tooth*.

It consists of sal ammoniac, sulphur, and finely pulverized castings or borings made into a paste.—**Portland cement, Roman cement.** See 2.—**Royal cement**†, a composition consisting of 1 part of sal ammoniac, 2 parts of common salt, and 4 parts of potters' earth or powdered bricks, the whole moistened with urine, and used in the cementation or purifying of gold. *E. cementation (sem-en-tā′shọn), *n.* [< *cement* + *-ation.*] **1.** The act of cementing; the act of uniting by an adhesive substance.—**2.** A metallurgical process in which two substances are heated in contact for the purpose of effecting some important chemical change in one of them. Iron may be carburized or decarburized by cementation. Thus, bar-iron, embedded in charcoal-powder and exposed to a temperature above redness, is gradually converted into steel, and in this way steel was formerly made in large quantity. This is carburization by cementation. Again, if cast-iron be embedded in the powder of red hematite and kept for some time at a red heat, it is decarburized, and acquires a considerable degree of malleability. This is the method in use for producing what is known as *malleable cast-iron.* Malleable iron is also converted into steel by keeping it immersed in molten pig-iron. This is a very ancient process, and is a kind of cementation. Silver is also separated from gold by cementation with salt and with potassium nitrate. These last methods of separation of the two precious metals are also very ancient, but are now nearly obsolete. See *case-hardening.* ★

cementation-box (sem-en-tā′shọn-boks), *n.* The box of wrought-iron in which case-hardening is effected. See *case-hardening.*

cement-mill (sē-ment′mil), *n.* A mill for crushing the stony concretions from which a form of cement is obtained.

cement-stone (sē-ment′stōn), *n.* Any rock which is capable of furnishing cement when properly treated. Much of the rock used in the United States for cement comes from the uppermost strata of the Upper Silurian system, and the product takes the name of *Rosendale cement* from the town of Rosendale in Ulster county, New York, where it is chiefly worked. The rock which furnishes cement is a more or less impure limestone, or mixture of carbonate of lime with sand and clay. Pure limestone will not make a mortar which will set under water; but some magnesian limestones have hydraulic properties. The theory of the hydraulicity of cement is not clearly understood, although much has been written in regard to it. Also *cement-rock.*

censorship (sen'sọr-ship), *n.* [< *censor* + *-ship*.] The office or dignity of a censor; the time during which a censor holds his office.—**Censorship of the press,** a regulation which formerly prevailed in most countries of Europe, and is still in force in some, according to which manuscripts, printed books, pamphlets, plays, and newspapers are examined by officials, civil or ecclesiastical, appointed for the purpose, who are empowered to prevent publication or suppress any parts of the text if they find anything in such books or writings obnoxious to the prevailing political or religious system. A general censorship of the press was established by the Roman Catholic Church as early as 1515, and is still enforced so far as its authority extends. In England there were "licensers" of books, who were for the most part bishops; a general system of censorship, established by a decree of the Star Chamber in 1637, remained in force during the civil war, and was confirmed by act of Parliament in 1643. Against this act Milton protested in his "Areopagitica: a speech for the liberty of Unlicensed Printing." The censorship, or license system, was abolished in England in 1694. In France a general censorship of the press existed from the introduction of printing till 1789, when it was abolished; and it has since been several times restored with various ameliorations and again abolished, finally in 1830, though a modified censorship of newspapers was afterward established and still exists. In Russia there is a very rigid censorship of the press. In Spain the censorship was abolished by the Constitution of 1837. In Germany, after great vicissitudes, the censorship has remained abolished since 1848. There is no authoritative censorship in Norway, Sweden, Denmark, the Netherlands, or Belgium, but penalties are imposed upon those who offend through the press. In the United States the press is, and always has been, absolutely free from any form of political or ecclesiastical censorship.

To *reproach* a person is to lay blame upon him in direct address, and with feeling, to endeavor to shame him with what he has done. In modern times, an official enumeration of the inhabitants of a state or country, with details of sex and age, family, occupation, possessions, etc. A census has been taken by the United States once in ten years, beginning with 1790; and many of the States take an intermediate census. The first actual enumeration of the peoples of England and Scotland was made in 1801. Since then a census, including Ireland, has been taken every ten years. In some countries a census is taken at intervals of three, five, or six years.

The myth is probably of Eastern origin. The centaurs, supposed to have inhabited Thessaly, were rude and savage beings, embodying the destructive and ungovernable forces of nature. Chiron, the wise instructor of Achilles, and Pholus, the friend of Hercules, were beneficent centaurs. In art the centaur was originally represented as a complete man, to whose body were attached, behind, the barrel and hind quarters of a horse; later this ungainly combination was abandoned, and was universally replaced by the form in which the human body to the waist took the place of the head and neck of the horse. Examples of the primitive type of centaur survive on archaic painted vases, in a few small bronzes, terra-cottas, etc., among the reliefs from the temple of Assos, and in certain wall-paintings.

Centigrade thermometer, a thermometer introduced by Celsius, and universally used by physicists, which divides the interval between the melting-point of ice and the boiling-point of water into one hundred equal parts called degrees. Since the zero of the centigrade thermometer is at the melting-point of ice, which corresponds to the 32°-point of Fahrenheit, and the boiling-point of the Fahrenheit scale is 212°, one hundred degrees centigrade equal one hundred and eighty degrees Fahrenheit, or 1° C. = 1.8° F. To convert a temperature of the Fahrenheit scale to centigrade, subtract 32, on account of the difference in the zero points, and multiply the remainder by $\frac{5}{9}$. To reduce centigrade temperatures to Fahrenheit, multiply by $\frac{9}{5}$ and add 32 to the product. The centigrade thermometer is the established household instrument in France and the other Latin countries, and it is rapidly superseding the Réaumur thermometer for common as well as scientific purposes in Germany.

And when
With wild wood-leaves and weeds I ha' strew'd his grave,
And on it said a *century* of prayers,
Such as I can, twice o'er, I'll weep and sigh.
Shak., Cymbeline, iv. 2.

How many of the *century* of graduates sent forth from our famous University every year . . . are able to read with moderate relish and understanding one of the Tusculan Disputations? *Dr. J. Brown*, Spare Hours, 3d ser., p. 44.

Specifically—**2.** In *Rom. antiq.*: (*a*) A division of the people (originally so called, probably, with reference to the approximate number of its members, though there was no fixed limit), instituted by Servius Tullius, formed with reference to taxation and to the election of magistrates and enactment of laws. All the citizens were divided into classes according to their wealth, and each of the classes was divided into from 10 to 40 senior and junior centuries, according to age, in all 193 or 194. Each century had one vote in the comitia centuriata, the wealthier classes voting first and generally controlling the others. (*b*) A subdivision of the legion, corresponding to a modern military company of infantry, and consisting nominally of a hundred men. Prior to the rule of Marius the century was half of a maniple, and contained normally 100 men, each century having in addition 20 light-armed troops. After the military reform of Marius the old distinctions of arms in the legion were abolished; the century was still the half

of the maniple, but its normal quota of men was increased. Under the empire the regular force of the century was 110 men. See *legion*.

(*c*) An allotment of land of varying size; especially, the area of land allotted to soldiers in a conquered country.—**3.** A period of one hundred years, reckoned from any starting-point: as, a *century* of national independence; a *century* of oppression. Specifically, one of a number of hundred-year periods, reckoned either forward or backward from some recognized era. Thus the *first century* of the Christian era began with the year A. D. 1 and extended to the end of the year 100; the *third century* began with 201 and ended with 300; and the *eighteenth century* began with 1701 and ended with 1800, the year completing the hundred-year period in each instance giving name to the century. When used absolutely, without explanatory adjunct of any kind, the centuries of the Christian era are always meant. The centuries before Christ are reckoned backward in their order from the Christian era, and those after Christ are reckoned forward: as, the fourth *century* B. C. (from 301 B. C. backward to 400).

One crash, the death-hymn of the perfect tree,

Now that the extended study of comparative anatomy and embryonic development is largely applied to the elucidation of the human structure, it is very desirable that descriptive terms should be sought which may without ambiguity indicate position and relation in the organism at once in man and (other) animals. Such terms as *cephalic* and caudal, dorsal and ventral, are of this class, and ought, whenever this may be done consistently with sufficient clearness of description, to take the place of those which are only applicable to the peculiar attitude of the human body. *Quain*, Anat., I. 6.

It is accomplished in various ways: by the transfer of members from the locomotive to the cephalic series; by participation of anterior locomotive organs in cephalic functions; by increased abbreviation, condensation, and perfection of structure anteriorly, with the opposite qualifications posteriorly; or by the uprising of the cephalic end, till at last the body becomes vertical.

A *rite* is generally a prescribed or customary form, while a *ceremony* may be improvised for an occasion: as, the *ceremony* of laying a corner-stone or opening a new bridge. *Observance* is primarily a compliance with a requirement, as in religion, where the word was applied to the act of compliance; as, the *observance* of the sabbath.

Heavy persecution shall arise
On all who in the worship persevere
Of spirit and truth; the rest, far greater part,
Will deem in outward *rites* and specious *forms*
Religion satisfied. *Milton*, P. L., xii. 534.

cestvaen (kest'vā-en or -vān), *n.* Same as *cist*[2].

cesura, cæsura (sē-zū'rä), *n.*; pl. *cesuras, cæsuræ* (-räz, -rē). [= F. *césure* = Sp. Pg. It. *cesura* = D. *caesuur* = G. *cäsur* = Dan. *cæsur*, < L. *cæsura*, lit. a cutting, < *cædere*, pp. *cæsus*, cut.] In *pros.*, a division made in a line by the termination of a word, especially when this coincides with a pause in delivery or recitation. Strictly, cesura is the division made by the termination of a word within a foot, the division occasioned by the concurrence of the end of a word with the end of a foot being called *dieresis.* This distinction of terms is not, however, generally observed in treating of modern poetry. A *masculine cesura* is one which immediately follows a syllable bearing the ictus or metrical accent; a *feminine cesura* is one which succeeds a metrically unaccented syllable. A cesura is called *trithemimeral, penthemimeral,* or *hephthemimeral,* according as it occurs in the middle of the second, third, or fourth foot. In the dactylic hexameter the cesura after the first of the two short syllables of the dactyl is called the *trochaic cesura* or *cesura after the trochee* (of the second, third, or fourth foot, as the case may be). In the same kind of verse a division at the end of the fourth foot is called a *bucolic cesura,* more accurately a *bucolic dieresis.* In the following examples the cesura is marked by a dagger (†), the dieresis by a parallel (‖). Thus, in the lines of English heroic verse (iambic pentapody) given below there is a dieresis after the third foot of the first line, and a cesura in the fourth and third feet of the second and third lines respectively.

Bĕfōre | thē hĭlls | ăppēar'd, ‖ ŏr fōun | tăin flōw'd,
Thōu with | Ētēr | nāl Wĭs | dōm † dĭdst | cōnvērse,
Wisdōm | thў sīs | tēr, † ānd | with hēr | dĭdst | plāy.
Milton, P. L., vii. 8.

A cesura occurs in the fourth foot of this iambic hexapody (trimeter):

Tŏ dēath's | bĕnūm | mĭng ŏ | pīūm † ās | mў ōn | lў cūre.
Milton, S. A., l. 630.

The remaining examples show different cesuras in the dactylic hexameter. One of the most usual is the penthemimeral: as,

Nāught būt trā | dĭtiōn rĕ | māins † ŏf thē | beaūtĭfŭl | vīllāge ŏf | Grānd-Prē. *Longfellow,* Evangeline, Int.

The trochaic cesura of the third foot is also very frequent: as,

Thīs ĭs thē | fōrĕst prĭ | mēvăl. † Thē | mūrmŭrĭng | pīnes ānd thē | hēmlŏcks. *Longfellow,* Evangeline, Int.

An example of the bucolic cesura (dieresis) combined (as is frequent) with the penthemimeral is:

Wē ōur | cōuntrў | flў, † thōu, | Tĭtўrŭs, ‖ strĕtched ĭn thĕ | shādōw. *Longfellow,* tr. of Virgil's Eclogue, i.

The hephthemimeral is generally preceded by a trithemimeral as secondary cesura: as,

Bēardĕd with | mōss, † ānd ĭn | gārmĕnts | grēen, † ĭndĭs- | tinct ĭn thē | twĭlīght. *Longfellow,* Evangeline, Int.

Chalcididæ[1] (kal-sid'i-dē), *n. pl.* [NL., < *Chalcis*[1] (*Chalcid-*) + *-idæ.*] In *entom.*, a large family of pupivorous spiculiferous hymenopterous insects, typified by the genus *Chalcis,* composed mainly of minute species most of which are parasitic on the larvæ or eggs of other insects. Some of them attack other parasites of the same or related families. The female chalcid, like the ichneumon-fly, deposits her eggs on the larva or egg which she infests, sometimes on the surface, sometimes beneath it, and often many together. The larvæ which emerge feed on the egg or on the soft parts of the infested larva; the latter is unable to complete its transformations, and eventually dies, when the chalcid emerges either as a perfect insect or as a larva, in the latter case sometimes spinning a rough cocoon in which to pass the pupa state. The *Chalcididæ* in their perfect state have usually hard and often brilliantly metallic bodies, from which the typical genus, *Chalcis,* takes its name; the antennæ are elbowed; the ovipositor issues before the tip of the abdomen; the pronotum does not reach the tegulæ; and the wings are almost devoid of veins. Such stone sculptures as have been found, particularly those excavated from 1877 to 1881 from the mound of Tello in southern Chaldea, indicate a much less conventional conception of the human form, and much more artistic promise, than was fulfilled in this branch of art by the Babylonian and Assyrian sculptors. — **Chaldean cycle.** See *cycle.* — **Chaldean era.** See *era.*

Gael. *cailc* = W. *calch*, lime, < L. *calx* (*calc-*), limestone, lime, chalk: see *calx*¹ and *calk*², and cf. *calcareous*, *causey*, etc.] **1.** In *geol.*, a soft white rock, consisting almost entirely of carbonate of lime in a pulverulent or only slightly consolidated state, and readily soiling the fingers when handled. It is seen, when examined through the microscope, to be made up in large part of minute fragments of the shells of *Foraminifera*, mollusks, and echinoderms, and also of spicules of sponges. It does not exactly resemble any deep-sea deposit at present known to be in process of formation. This rock is a very important and conspicuous formation on the south coast of England (which on account of the whiteness of its cliffs is poetically styled Albion) and in the north of France. Under the city of London it has a thickness of from 600 to 800 feet. The chalk gives its name to the so-called Cretaceous formation. It has a limited distribution in other parts of the world, but the best known localities are the Paris and London basins. Chalk, being a nearly pure carbonate of lime in a pulverized condition, is an article of great commercial importance, and is used in a large number of operations. For such purposes it is crushed and levigated. One of its principal uses is for whitening walls, or whitewashing. It is not used with oil, as it has no body with that vehicle; but, on account of its being very much cheaper than lead paint, it supersedes that article to a great extent. There are many names for the various preparations of chalk, as *whiting*, *Spanish white*, *Paris white*, etc. Chalk is not a desirable material for ordinary mortar, but it is used to some extent as one of the ingredients of hydraulic cement. See *cement*, 2.

9. In *law*, an objection to a juror; the claim of a party that a certain juror shall not sit in the cause. The right of challenge is given in both civil and criminal trials, for certain reasons which are supposed to disqualify a juror to be an impartial judge. The challenge may extend either to the whole panel or body of jurors, called a *challenge to the array*, or only to particular jurors, called a *challenge to the polls*. Both of these challenges are subdivided into *principal challenges* (or challenges for principal cause) and *challenges to the favor*. A *principal challenge* is a challenge which alleges a fact of such a nature that, if proved, the juror is disqualified as a matter of law, without inquiring whether he is actually impartial: as, that one or more of the jury are returned at the nomination of the other party, or are nearly related to the other party. A *challenge to the favor* consists in the allegation by the party of a cause that might probably bias, and the raising of the question whether the juror is in fact impartial: as, a statement that a juror has already formed an opinion, or is prejudiced against the party. A *peremptory challenge*, allowed by statute in many jurisdictions, is a challenge of jurors, to a limited number, to be taken without showing any cause at all.

touch, and contains small grains or eminences which are of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. The extraordinary faculty which the chameleon possesses of changing its color, in accordance with that of the objects by which it is surrounded or with its temper when disturbed, is due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilatations being under the control of the nervous system. Its power of fasting and habit of inflating itself gave rise to the fable that it lives on air. It is in reality insectivorous, its tongue, which is long and covered with a viscid saliva, being darted at its prey and securing it when touched.

The vineyards are all situated within a district about twenty miles long, from Reims on the north to Vertus on the south, and are generally classed as "of the Hill" (*montagne*) and "of the River," namely, along the Marne; but great quantities of new wine are brought from other regions, and each manufacturer makes a mixture or blend according to his own system, to produce the brand of wine known by his name. The effervescence is artificially produced, and is of the nature of an arrested or incomplete fermentation. The greater or less sweetness of the wine is produced by the addition of a liqueur consisting of sugar-candy dissolved in old wine; the different degrees of sweetness are indicated by the terms *sec*, 'dry,' *doux*, 'sweet,' and *brut*, which last term, denoting originally the new or unmanipulated wine, is now used for the manufactured wines having from 1 to 3 per cent. of liqueur. The sweeter wines are generally the more effervescent.

The *fines champagnes* are the product of a blending of the brandies produced in this and neighboring regions of southwestern France with alcohols derived from grain or from beet-roots, the two kinds of alcohol giving rise to distinct flavors in the brandy. An inferior grade, known as *petite champagne*, is made from grapes grown in the southern part of the district.—**Champagne rosé**, champagne having a slightly pink or ruddy tint. This color is usually produced by the addition of a little red wine.—**Still champagne**, properly, non-effervescent wine made in Champagne, of which the best-known is *sillery sec;* improperly, slightly effervescent champagne, as distinguished from the *grand mousseux* or frothing variety.—**Tisane de Champagne**. This application of the term has become general, but it is without the sanction of priority, and there is a disposition at present to abandon it in favor of the earlier meaning.

chancel, L. *cancelli*, pl., a grating, latticework: see *cancel*.] **1.** *Eccles.*, the inclosed space in a church surrounding the altar, and railed off from the choir; the sanctuary. In small churches having no separate choir the altar-rails (and in some churches the screen or latticework) divide the chancel immediately from the body of the church. In a wider sense the words *chancel* and *choir* are sometimes used to include both the sanctuary and the choir proper. In Greek churches the *bema* answers to the chancel or sanctuary, and the *iconostasis* (as the choir does not intervene between sanctuary and nave) corresponds in some measure to both altar-rails and rood-screen, to the former as separating the altar from the rest of the church, and to the latter as constituting a marked boundary to the nave. **2.** An inclosed space railed off in courts of judicature.

chancellor (chan'sel-or), *n.* [< ME. *chanceler, chaunceler, chaunseler* (always with one *l*), < OF. *chanceler, -lier*, F. *chancelier* = Pr. *cancelier, chancellier* = Cat. *caceller* = OSp. *canceller, canciller*, Sp. *cancelario* = Pg. *chanceller, cancellario* = It. *cancelliere* = D. *kanselier* = MLG. *kenselere* = OHG. *chancilāri, chenzilāri*, MHG. *kanzelære*, G. *kanzler* = Dan. (LL.) an officer in charge of records, who stood at the latticed railing inclosing the judgment-seat, and acted as an intermediary between the suitors and the judge; < L. *cancelli*, a latticed railing: see *chancel* and *cancel*, and cf. *chancery*.] **1.** Originally, under the later Roman emperors, a doorkeeper or usher, who stood at the latticed railing inclosing the judgment-seat, to keep off the crowd and to introduce such persons as were entitled to pass inside. Later and naturally he became a sort of intermediary between petitioners and the judges, and arranged about their business. In the Eastern Empire, the Roman-German empire, and the kingdoms established on the ruins of the Roman empire, this intermediary doorkeeper became a notary or scribe on whom devolved the duty of preparing and sealing all important documents, such as charters, letters, and other official writings of the crown; hence he became keeper of the great seal, and in consequence of the influence of his position his office came to be one of the most important. From the Roman empire the ecclesiastical court at Rome introduced the office, and the chancery at the Vatican was repeated throughout the several bishoprics, where each diocese, and frequently each of the great monastic houses, had its chancellor.

Hence—**2.** A secretary; a notary.

> One Gilbert Peck, his [the Duke of Buckingham's] *chancellor*. *Shak.*, Hen. VIII., i. 1.

3. In Great Britain: (*a*) The highest judicial officer of the crown, law adviser of the ministry, and keeper of the great seal: more fully designated *lord high chancellor*. He is a cabinet minister and privy councilor by virtue of his office, and prolocutor of the House of Lords by prescription, and ranks next after the princes of the blood and the Archbishop of Canterbury. The writs for the convocation of Parliament are issued by him. To him belongs the appointment of all justices of the peace, and he is the patron of all livings of the crown under the value of twenty marks in the king's books; he is keeper of the sovereign's conscience, visitor of all hospitals and colleges founded by the king, guardian of all charitable uses, and judge of the High Court of Chancery, now called the Chancery Division of the Supreme Court. There is also a lord high chancellor in Ireland at the head of the equity system of that country, and Scotland had a chancellor until the treaty of union with England in 1707. (*b*) An officer, officially styled *chancellor of the duchy of Lancaster*, who presides in person or by deputy over the courts of law and equity in the duchy of Lancaster. He is usually a cabinet minister, and seldom a lawyer. (*c*) The finance minister of the British government, more fully styled *chancellor of the exchequer*. He is invariably a member of the House of Commons (that division of the legislature having the sole right of laying taxes and originating money bills) and also of the cabinet. The chancellor of the exchequer was formerly a judge *ex officio* in the equity department of the Court of Exchequer, taking precedence of all the barons; but when the equitable jurisdiction of this court was transferred by 5 Vict. v. to the Court of Chancery his judicial functions became obsolete. (*d*) In the jury system of Scotland, the preses or foreman of a jury, who announces the verdict when it is a verbal one, and who, when it is in writing, hands it in and indorses it, in the name of the jury, along with the clerk of the court.—**4.** In France: (*a*) The chief officer of the crown, charged with the custody of the great seal, the administration of justice, and the duty of presiding over the councils of the king. (*c*) A secretary, especially of an embassy or a consulate.—**5.** In the new German empire, the president of the Federal Council, who is also charged with the supreme direction, under the emperor, of all imperial affairs.—**6.** The chief officer, next to the honorary head, of a military or honorable order, who guards its seal, administers its property, and preserves its records: as, the *chancellor* of the Order of the Garter.—**7.** *Eccles.*: (*a*) An officer learned in canon law, who acts as vicar-general to a bishop, holds his courts, and directs and advises him in all matters of ecclesiastical law, and is the keeper of his seals. More fully styled *chancellor of a bishop* or *of a diocese*. (*b*) An officer belonging to a cathedral, who arranges the celebration of religious services, hears lessons, lectures in theology, writes letters of the chapter, applies the seal, keeps the books, etc.—**8.** The titular head of a university, from whom all degrees are supposed to emanate. The chancellor was originally the notary of the chapter of the cathedral. But nobody could preach without the authorization of the bishop; and the pope as the chief of the bishops undertook to regulate this authorization. He made the chancellors of certain cathedrals his deputies for this purpose, and thus they alone could grant the degree of master of theology, the highest of the university, which carried with it the right to preach. The chancellors seldom took an active part in the government of the university. In Great Britain the office is now a merely honorary one, and is usually held by a nobleman or some statesman of eminence. The duties of the chancellor of Oxford or Cambridge are usually discharged by a vice-chancellor. There is an officer with similar functions in several of the colleges of the United States.

With *chant* of tuneful birds resounding loud.
Milton, P. R., ii. 290.

Specifically—(*a*) A melody composed in the Ambrosian or Gregorian style, following one of the ecclesiastical modes, having often a note for each syllable, and without a strict rhythmical structure: sometimes called a *tone;* when used in contrapuntal composition, called a *canto fermo.* (*b*) A Gregorian melody, usually of ancient origin, intended to be used with a prose text in several verses, several syllables in each verse being recited or intoned upon a single note. A Gregorian chant of this kind has five parts: the intonation, the first dominant or reciting-note, the mediation, the second dominant or reciting-note, and the ending or cadence. (*c*) A short composition in seven measures, the first and fourth of which contain but one note, whose time-value may be extended at will so as to accompany several syllables or words, while the remaining measures are sung in strict rhythm: commonly called an *Anglican chant,* because most extensively used in the services of the Anglican Church for the canticles and the psalms. An Anglican chant consists of two parts, the first of three and the second of four measures; each half begins with a reciting-note and ends with a cadence; the first cadence is also called the *mediation.* A *double chant* is equal in length to two typical or single chants, that is, contains fourteen measures, four reciting-notes, etc. The distribution of the words of a text for use with a chant is called *pointing* (which see). The Anglican chant is probably a modernized form of the Gregorian, without an intonation, having the mediation and cadence made strictly rhythmical, and following the modern ideas of tonality and harmony. (*d*) Any short composition one or more of whose notes may be extended at will so as to accompany several syllables or words.

8. In *law*, a gift in trust for promoting the welfare of the community or of mankind at large, or some indefinite part of it, as an endowment for a public hospital, school, church, or library, as distinguished from a gift which, being for the benefit of particular persons, gives them a right to its enjoyment. Early in the history of English law, the chancellors established the rule that informalities and illegalities which by the common law would invalidate a private trust should not be allowed to defeat a public charity, and that therefore chancery should intervene to prevent the heirs or next of kin from defeating such a gift, should appoint a trustee if none existed, and, if any of the directions of the founder were impracticable, should supply others approximate thereto. The most familiar application of the rule is in the doctrine that the prohibition against perpetuities does not affect a charity. (See *perpetuity*.) The question what constitutes a charity within this rule has been the subject of much litigation.—**Brothers of Charity.** (*a*) A religious order founded by St. John of God at Seville in Spain about 1540, and extended over Spain and France, now having about 100 houses. chasuble (chaz′ū-bl), *n.* [Also written *chasible, chesible;* < ME. *chesible, chesuble,* etc., < OF. **chasible, chasuble,* F. *chasuble* (= Sp. *casulla;* cf. MHG. *kasugele, kasuckel,* D. *kasuifel*), < ML. *casubula, casubla,* equiv. to *casula,* a mantle, a chasuble, lit. a little house (cf. It. *casupola,* a shanty), dim. of L. *casa,* a house: see *casa.* Cf. *casula* and *cassock,* of the same ult. origin.] *Eccles.*, a sleeveless vestment, originally circular in outline, but in medieval and modern use of an elliptical shape, or modified from this so as to be nearly rectangular, and provided with an aperture in the center through which to pass the head. It is worn so as to fall in front and at the back of the wearer to an equal or nearly equal distance, showing only one of its halves at a time. The chasuble is the principal vestment worn by a priest when celebrating the mass or holy communion, and is put on over the alb. It is held to represent the seamless coat of Christ, or charity symbolized by it. The material is usually rich stuff—silk, brocade, or velvet. In its oldest form it was very full and long, reaching nearly to the feet. The medieval or elliptical form, which is sometimes worn in Roman Catholic churches, reaches below the knees, and is generally ornamented with a Y-cross. The shape commonly worn in the Roman Catholic Church, however, does not reach much below the hips, and is nearly rectangular at the back, the part which falls in front being cut away at the sides so as not to impede the movement of the arms, and the two parts are frequently united merely by straps at the shoulders. The chasuble generally has a pillar or vertical stripe at the front, a Y-cross or Latin cross on the back, or on both front and back, and sometimes an edging on both sides. These ornaments are added in a different material with gold or other embroidery, and are known as the *orphreys of the chasuble.* Among the different names of the chasuble, *pænula,* identifying it with the ancient Roman garment of that name, is probably the oldest. The same word occurs also in various Greek forms. It is translated "cloke" in 2 Tim. iv. 13, and is the accepted name for the chasuble in the Greek Church, generally in the form *phelonion.* The name *planeta* has also been in use from early times, and is still the term preferred in the official use of the Roman Catholic Church. The *amphibalus,* worn at one time in Gaul, seems to have been similar to or identical with the chasuble. In England the name *vestment* was in use at the time of the Reformation, both for the chasuble alone and for the chasuble with its subsidiary vestments or adjuncts, the stole, amice, and maniple. The use of the chasuble in Anglican churches continued long after the Reformation, and is maintained by certain of them (on authority claimed from the Ornaments rubric) at the present day. It is also worn in the Greek Church. See *ornament.*

See *casein,* etc. The Scand. word is different: Icel. *ostr* = Sw. Dan. *ost,* cheese.] 1. The curd or casein of milk, coagulated by rennet or some acid, separated from the serum or whey, and pressed in a vat, hoop, or mold. All the acids separate the cheese from the whey; neutral salts, and likewise all earthy and metallic salts, produce the same effect; but rennet, which is made by macerating in water a piece of the last stomach of a calf, salted and dried for this purpose, is most efficient. The flowers of the *Galium verum,* or yellow lady's-bedstraw, and the juice of the fig-tree very readily coagulate milk. There are many kinds of cheese, which differ from one another according to the quality of the milk employed and the mode of preparation. *Soft cheeses,* such as cream-cheese, Bath and Yorkshire cheese, will not keep long. *Hard cheeses,* as Cheshire, Gloucester, Cheddar, Parmesan, and Dutch, can be kept a long time. There is also an intermediate class, as Gruyère, Stilton, etc. Cheese is composed of from 30 to 50 per cent. of water, 20 to 35 per cent. of casein, 30 to 40 per cent. of fat, and 4 to 6 per cent. of mineral matter.

These animals have the bones of the skull united to such a degree that the quadrates and pterygoids form part of the same mass as the rest; there are no teeth, the jaws being incased in horn and forming a beak; the eyes are provided with eyelids; and a sacrum is developed. In consequence of the formation of the shell, the cervical and caudal regions are the only movable parts of the spinal column; the dorsal vertebræ are devoid of transverse processes; the ribs are not movable upon the vertebræ; and the union of the vertebræ and ribs by means of superficial bony plates almost always forms the carapace or upper shell, the lower shell or plastron being composed of dermal bones, usually 9 in number, 1 median, and 4 lateral and paired. Tortoise-shell is the peculiar epidermal or exoskeletal integument of the bony case. The lungs extend into the abdominal cavity with the other viscera. long periods without food. Some, however, are quite active. They are oviparous. Most of the species are carnivorous and predatory, but the true land-tortoises are mainly herbivorous. There are over 200 species, among them a few gigantic ones, as the tortoises of the Galapagos and Mascarene islands: one of the fossil species is said to have been about 20 feet long. The living genera are very numerous. The *Chelonia* are variously subdivided. They were formerly generally distributed among four families, the club-footed land-tortoises, the related fresh-water tortoises, the soft tortoises, and the sea-turtles. Huxley called these four groups *Testudinea*, *Emydea*, *Trionychoidea*, and *Euereta*. These groups have, however, been long discarded, and the species are now segregated among many families which have been variously combined. Most of the species of the southern hemisphere belong to a peculiar old-fashioned group, the pleurodirous, while those of the northern are cryptodirous. Also *Chelonides*, *Chelonii*.

Chemical acetification. See *acetification*.—**Chemical action.** See *action*.—**Chemical affinity, elective affinity,** names formerly used for chemical force, and implying a property inherent in atoms of selecting other atoms with which to unite, or of preferring one combination to another.—**Chemical analysis,** the resolution of complex bodies into their elements. It is either qualitative or quantitative. Qualitative analysis consists in the determination of the component parts merely as respects their nature, and without regard to their relative proportions. Quantitative analysis consists in the determination of the relative proportions of the components.—**Chemical black, bronze.** See *black*, *bronze*.—**Chemical change,** as distinguished from *physical change*, a change which destroys the identity of the substance affected. A physical change is manifested without loss of identity by the substance. Thus, a mass of copper may be reduced to fine particles, drawn into wire, melted and cast into ingots or charged with electricity, without losing its identity as copper. But if copper is put into nitric acid, it dissolves and is converted into another substance, copper nitrate. The copper, in consequence, has lost its identity, and has undergone a chemical change.—**Chemical combination,** the intimate union by chemical force of two or more elements or compounds to form a new compound differing in properties from either of its constituent bodies. It differs from *mechanical mixture* in that each element of a chemical combination has a certain fixed and invariable combining proportion, whereas a mixture of substances can be made with varying amounts of its ingredients. In a mechanical mixture the particles of each of its ingredients can usually be identified and separated by mechanical means; in a chemical combination the constituents are so blended that they cannot be identified. Thus, if chlorin and hydrogen gas are mixed in any desired proportion, the chlorin in the mixture will be evident by its characteristic color and odor. But if this mechanical mixture is exposed to strong light, a chemical combination takes place rapidly between the two gases, with evolution of heat. They combine, however, only in exactly equal volumes, and if an excess of either is present it remains uncombined. In the new compound, hydrochloric acid, chlorin cannot be detected by either color or smell, nor be isolated except by chemical means.—**Chemical decomposition,** the separation by chemical force of the component parts of bodies from one another, or the resolution of bodies into their elements.—**Chemical equation,** a symbolic expression used to represent a chemical reaction. The reagents, or bodies which enter into the reaction, form the left-hand member of the equation, and the resultants of the reaction form the right-hand member. Thus, the fact that calcium chlorid and sodium carbonate when brought together in solution react on each other, forming calcium carbonate and sodium chlorid, is expressed by the following equation:

$$CaCl_2 + Na_2CO_3 = CaCO_3 + 2NaCl.$$

This is a true equation in the algebraic sense, because the value of the two members is the same. Since matter is indestructible, nothing is lost in the reaction, and the weights of calcium chlorid and sodium carbonate which reacted must be precisely the same as the combined

weights of the resultant calcium carbonate and sodium chlorid.—**Chemical equivalent, extinguisher, ferment, fire-engine,** etc. See the nouns.—**Chemical force,** the force which binds together the atoms in a molecule, and causes chemical changes when dissimilar molecules are brought within the sphere of its action under proper conditions.—**Chemical formula,** a symbolic expression used to represent the composition of a substance. In the formulas now generally adopted by chemists each elementary substance is indicated by the first letter or letters of its name, called its chemical symbol; and to express the compounds of the elements, their symbols are arranged together, each denoting a single atom, and small numbers are written after a symbol and a little below (sometimes, and formerly always, above) the line, indicating how many atoms of the element exist in the compound. Thus, H means 1 atom of hydrogen; H_2O means 2 atoms of hydrogen united with 1 of oxygen, forming the compound water; KHO means 1 atom of potassium (kalium), 1 of hydrogen, and 1 of oxygen, forming the compound potassium hydrate; and so on. If a number is placed at the beginning of the formula, it multiplies the entire formula like an algebraic coefficient; thus, $2H_2O$ means 2 parts or 2 molecules of water. So, too, a small number placed after a parenthesis multiplies the portion included; thus, $Ca_3(PO_4)_2$ denotes 3 atoms of calcium combined with 2 equivalents of the radical PO_4, forming tricalcium phosphate or bone phosphate. Chemical formulas are of two kinds, *empirical* and *rational*. An empirical formula expresses simply the relative number of atoms of the elements present; a rational formula expresses not only the relative number of atoms, but also some conception of the mode of union of the atoms, the groups of radicals contained in the substance, the class to which it belongs, etc. Thus, the empirical formula of acetic acid is $C_2H_4O_2$. Its rational formula ($CH_3CO.OH$) indicates that it may be regarded as made up of the radicals methyl (CH_3), carbonyl (CO), and hydroxyl (OH), and so suggests to the chemist many of its properties and reactions. ★**chemin-de-ronde** (F. pron. shė-maṅ'dė-rôṅd'), *n.* [F.: *chemin*, road, way; *de*, of; *rond*, round.] In *medieval milit. arch.*, a continuous footway upon the top of the ramparts, protected by the battlements, and affording means of communication between towers and bastions. In the earlier castles the system of defense adopted involved almost complete separation of each tower or post from the others, and the *chemin-de-ronde* was intercepted by each of these; this caused the loss of many fortresses, a sudden attack often shutting up the defenders in their isolated posts. The castles of the fourteenth century were free from this defect, the *chemin-de-ronde* becoming spacious and uninterrupted, so that the garrison could be massed readily at any point.

★**chemistry** (kem'is-tri), *n.* [Also recently *chymistry*, by apheresis for earlier *alchemistry, alchymistry;* now regarded as < *chemist* + *-ry:* see *chemist, alchemy,* and *alchemistry*. Other names for the science are *chemics* and *chemy:* see these words.] The science of the different kinds of matter, and their mutual relations so far as these depend upon such difference in kind. It regards all substances as made up of atoms (see *atom*) which are indivisible and have certain unchanging properties. An elementary substance consists of atoms or groups of chemically united atoms of the same kind; a compound substance, of groups of chemically united atoms of two or more different kinds. All compound substances, and most elementary ones, consist of definite groups of chemically united atoms which are called *molecules*. Each molecule has exactly the same chemical composition and properties as the whole mass of the substance, and is the smallest mass into which the substance can be divided without losing its identity. The laws, causes, and effects of changes in the kind, and the number and arrangement, of atoms within the molecule are the subject-matter of the science. chemitype (kem'i-tīp), *n.* [< *chemi(cal)* + *type*.] A process for obtaining casts in relief from engravings. A polished zinc plate is covered with an etching-ground, on which the design is etched with a point and bitten in with dilute aqua fortis. The etching-ground is then removed, and every particle of the acid well cleaned off. The plate is covered with filings of a fusible metal, and heated until the metal has melted and filled the engraving. When cold it is scraped away to the level of the zinc plate in such a manner that none of it remains except what has entered the engraved lines. The plate is next submitted to the action of a weak solution of muriatic acid; and, as the one of these metals is negative and the other positive, the zinc alone is eaten away by the acid, so that the fusible metal which has entered the hollows of the engraving is left in relief, and may be printed from in a press. Chemitype is particularly adapted for the production of maps.

Κερασοῦς, an ancient town in Pontus, where the cherry-tree was native.] **I.** *n.*; pl. *cherries* (-iz). **1.** The fruit of species of *Prunus* (subgenera *Cerasus* and *Padus*), consisting of a globose pulpy drupe inclosing a one-seeded smooth stone; also, a tree producing this fruit. The cultivated varieties of the garden-cherry probably all belong to two species, *Prunus Cerasus* and *P. avium*, both doubtless natives of Europe. It is related by Pliny that this fruit or a cultivated variety of it was brought from Cerasus in Pontus to Italy after the defeat of Mithridates by Lucullus, about 70 B.C. It was introduced into England by the Romans about 120 years afterward. The sweet cherries (*P. avium*) are divided into four classes: mazards, natural seedlings of *P. avium*, used as stocks; hearts, heart-shaped sorts with soft, sweet flesh; bigarreaus, heart-shaped, firm-fleshed, sweet cherries; and dukes, mostly light-colored, with somewhat acid flesh. The sour cherries, *P. cerasus*, have two subdivisions: amorelles, light-colored, sour cherries with colorless juice, and morellos, dark-colored, with dark juice. To this group of cherries, distinguished by having their flowers and fruits in clusters, belong also the mahaleb cherry (*P. Mahaleb*), extensively used as a stock, and the ground-cherry (*P. Chamæcerasus*), as well as the wild red cherry (*P. Pennsylvanica*) and the dwarf cherry (*P. pumila*) of North America. A second section of the genus has the flowers in racemes, and the fruit smaller and less palatable. To this belong the bird-cherry (*P. Padus*) of Europe, and the wild black cherry, also called the rum- or cabinet-cherry (*P. serotina*), and the choke-cherry (*P. Virginiana*) of America. Still a third section consists of evergreen trees, with the flowers in racemes and the fruit inedible, including the bastard cherry, bay-cherry, or laurel-cherry (*P. Lauro-Cerasus*) of Europe, and the Carolina laurel-cherry (*P. Caroliniana*) of the southern United States.

A double E. pl. *cherubims* occurs in the Bible and elsewhere.] **1.** One of an order of angels variously represented at different times, but generally as winged spirits with a human countenance (often simply as winged heads), and distinguished by their knowledge from the seraphs, whose distinctive quality is love. In the celestial hierarchy cherubs are represented as next in order to seraphs. The first mention of cherubs is in Gen. iii. 24, where their figure is not described, but their office was, with a flaming sword, to keep or guard the way of the tree of life. Figures of a pair of cherubs were placed on the mercy-seat of the ark, and a pair of colossal size overshadowed it in Solomon's temple with the canopy of their contiguously extended wings. They are called "the cherubims of glory" (Heb. ix. 5), as on them the glory, when visible, rested. They were anointed with the holy oil, like the ark itself and the other sacred furniture. Their wings were stretched upward, and their faces turned "toward each other, and toward the mercy-seat." The cherubs seen in Ezekiel's vision had each four heads or faces, the hands of a man, and wings. The four faces were the face of a cherub, that of a man, that of a lion, and that of an eagle. They had the bodily form of a man. (Ezek. x.) The hieroglyphical and emblematical figures embroidered on the veils of the tabernacle were called "cherubims of cunning work" (Ex. xxvi. 1).

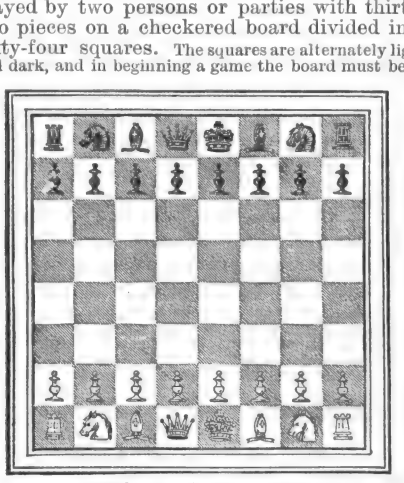
chess[1] (ches), *n.* [Early mod. E. also *chesse*, ★*chests*, < ME. *ches*, *chesse*, < OF. *esches*, *eschas*, *eschecs*, plural of *eschec*, *eschac*, check; F. pl. *échecs*, chess, = It. *scacchi* (ML. *scacci*), pl., = D. *schaak* = G. *schach* = Dan. *schak* = Sw. *schack* = Icel. *skāk*, chess, ult. < Pers. *shāh*, king: see *check*[1], *n.*, and *shah*.] A very ancient game played by two persons or parties with thirty-two pieces on a checkered board divided into sixty-four squares. The squares are alternately light and dark, and in beginning a game the board must be so placed that the square at the right-hand corner is a light one. The vertical rows of squares are called *files*, those which run from right to left, *ranks* or *lines*, and those (of the same color) which run obliquely, *diagonals*. Each party has sixteen pieces, differently colored to distinguish those of one side from those of the other, viz., a king, a queen, two bishops, two knights, and two rooks or castles, placed on the squares of the end line of the board, and eight pawns placed on the next line in front. The king and queen are placed on the two middle squares, the queen on her own color (light or dark), and by the side of each are placed a bishop, a knight, and a rook, in this order. The pieces move according to certain laws over unoccupied squares, the knight alone being free from this latter restriction (see below). The king moves one square in any direction (except into check); the queen in any direction and to any distance along the rows of squares, and also along the diagonals; the rooks or castles in any direction along the files or ranks of squares; the bishops (of which there is one on each color) in any direction along the diagonals of the color on which they are originally placed; the knights one square on one row and then two squares on the row at right angles to it (or two squares and then one) in any direction, without reference to interposing pieces; and the pawns one square ahead on the files. A piece is taken by removing it from the board and placing the capturing piece in its place. In taking, each piece makes some one of its ordinary moves, except the pawn, which takes by moving one square forward on a diagonal; the knight alone can take by jumping over an intervening piece. The object of the game is to capture the king of the opposing party; and this is effected by an attack so planned that it is impossible, either by moving the opposing king or by interposing another piece, to prevent him from being taken on the next move—that is, by placing the opposing king in a check from which he cannot escape. (See *check*[1], *checkmate*, and *stalemate*.) The squares of the board are commonly numbered along the files, forward from either party, from the principal pieces placed upon them at the beginning of a game: as, the queen's rook's square (abbreviated Q. R. sq.), queen's rook's second square (Q. R. 2), etc.



Chess-board, with pieces in position.

Four and twenty ladies fair
Were playing at the *chess*.
The Young Tamlane (Child's Ballads, I. 117).

Chess has been known to the Chinese for many centuries under a form not very unlike our own game. The board has 64 squares, is played with 16 men on each side, the two at the corners having equal power, and the next two (called horses) having a move equivalent to that of our knight. The chief differences are that the Chinese adversaries are separated by a river, over which some pieces cannot pass, while the "King" is confined to a square of nine moves only; and that the pieces are placed upon the intersections of the lines forming the board, instead of on the squares. *Giles*, Glossary of Reference, p. 38.

The origin of the game of *chess* is lost in obscurity, a fact which has rather invited than repelled learned speculations on the subject. The invention of the pastime has been variously ascribed to the Greeks, Romans, Babylonians, Scythians, Egyptians, Jews, Persians, Chinese, Hindus, Arabians, Araucanians, Castilians, Irish, and Welsh. *Encyc. largely influenced by this material. The roofs are usually tiled, and have characteristically a hollow dip, as if copied from the form of a tent. When rectangular, the lower corners are sharply turned up. Roofs in several projecting tiers, one over the other, are usual in temples and towers. The tiling of the roofs is often glazed in various colors, and the walls are frequently incrusted with porcelain tiles, and sometimes with marble slabs. The porcelain tower or *ta* of Nanking, destroyed in 1853, was a building of this nature; it was 200 feet high, had 9 stories, and was surmounted by an iron spire or finial. The *pai-low*, or carved memorial gateway, is another feature of Chinese architecture. A peculiarity of Chinese building is the practice of beginning with the roof, which is supported on posts, and the walls are then built beneath it. Chinese drawing and painting are often of great delicacy, but show no knowledge of perspective. In the decorative branches of art, much of the work of the Chinese is of high merit. Their small bronzes, and carvings in wood and ivory, are of great technical excellence, and as makers and decorators of porcelains they are unsurpassed. They are fond of the grotesque, and are very successful in decorative treatment of it, as, for instance, in their favorite carved and painted figures of dragons and kindred fantastic creations.—**Chinese blue, capstan, classics, crossbow, duck, fire, lantern, wax, white, yellow,** etc. See the nouns.

2. The language of China. It is a monosyllabic tongue, and on this ground is generally classed with the other languages of the same character in southeastern Asia, in Further India and the Himalayas, as constituting the monosyllabic family. It exists in many dialects, of which the so-called Mandarin is the leading and official one. It is composed of only about 500 words, as we should distinguish them in writing, all of them ending in a vowel-sound or in a nasal, although some of the dialects still retain final mutes, lost in Mandarin. This small body of words, however, is raised to 1,500 by differences of the tone of utterance, as rising, falling, even, abrupt, and so on. The language is without inflection, and even without distinction of parts of speech; but words are classed as "full" or "empty," according as they are used with their full meaning or as auxiliaries in forming phrases: like our *will* and *have* in "I *will* it," "they *have* it," on the one hand, and in "they *will have* seen it," on the other. Chinese records go back to about 2000 B. C., and the literature is immense and varied. The mode of writing is by signs that represent each a single word in one of its senses or in a certain set of senses. The signs are of ideographic or hieroglyphic origin; but the greater part of them at present are compound, and many contain a phonetic element along with an ideographic. They number in the dictionaries about 40,000; but only the smaller part of these are in current and familiar use. They are written in perpendicular columns, and the columns follow one another from right to left. The language and mode of writing have been carried to the neighboring nations that have received their culture from China, especially Japan, Corea, and Annam, and have been more or less borrowed or adopted by such nations.

Gr. costume*, a form of mantle which left both arms free, worn especially by equestrians, hunters, and travelers, and by soldiers. The chlamys, which was much smaller than the himation, consisted of an oblong piece of stuff having three straight sides and one long side curved outward. It was worn by bringing the two ends of the straight side opposite the curved side together around the neck, and fastening them with a buckle or fibula. The buckle was pulled around to the front, to either shoulder, or to the back, to suit the convenience of the wearer. The extremities of the curved side were weighted so as to hang vertically; and when the chlamys was caught together on one shoulder, as it was commonly worn, these hanging ends were likened to wings by the old writers. The paludamentum of the later Roman emperors was called *chlamys* by the Greeks.

The *chlamys* [in the sculptures of the Mausoleum] floating behind the Amazon on horseback adds to its simplicity a massiveness of fold and general form beyond anything to be seen in similarly floating drapery on the other slabs.

chlorin, chlorine (klō'rin), *n.* [< Gr. *χλωρός*, greenish-yellow (see *chlor-*), + *-in*[2], *-ine*[2].] Chemical symbol, Cl; atomic weight, 35.46. An elementary gaseous substance contained in common salt, from which it is liberated by the action of sulphuric acid and manganese dioxid. Chlorin has a yellowish-green color and a peculiar smell, and irritates the nostrils very violently when inhaled, as also the trachea and lungs. It exercises a corrosive action upon organic tissues. It is not combustible, though it supports the combustion of many bodies, and indeed spontaneously burns several. In combination with other elements it forms chlorids, which serve most important uses in many manufacturing processes. It can be liquefied by cold and pressure. It is one of the most powerful bleaching agents, this property belonging to it through its strong affinity for hydrogen. Hence in the manufacture of bleaching-powder (chlorid of lime) it is used in immense quantities. When applied to moistened colored fabrics, it acts by decomposing the moisture present, the oxygen of which then destroys the coloring matter of the material. It is a valuable disinfectant when it can be conveniently applied, as in the form of chlorid of lime. See *calx chlorata*, under *calx*[1]. — **Chlorin process**, in *metal.*, a process extensively used for separating gold from silver. It is based upon the fact that gold at a red heat has no affinity for chlorin, the chlorid of gold being reduced to the metallic state by heat alone, while this is not true of the metals with which the gold is usually alloyed.

It is prepared by cautiously distilling together a mixture of acetone, water, and chlorid of lime or bleaching-powder. Its chief use is in medicine as an anesthetic in diseases attended with great pain, in surgical operations, and in childbirth. For this purpose its vapor is inhaled. The inhalation of chloroform first produces slight intoxication; then, frequently, slight muscular contractions, unruliness, and dreaming; then loss of voluntary motion, consciousness, and sensibility, the patient appearing as if sound asleep; and at last, if too much is given, death by failure of the heart or respiration. When skilfully administered, in proper cases, it is a safe anesthetic. ★**chlorophyl, chlorophyll** (klō'rō-fil), *n.* [< NL. *chlorophyllum*, < Gr. *χλωρός*, yellowish-green, + *φύλλον* = L. *folium*, a leaf.] The green coloring matter of plants. It is this pigment which gives the color to chloroplastids. Chloroplastids occur in the green parts of all plants, and are rarely found in cells that are not exposed to the light. In some of the lower cryptogamic plants the chlorophyl permeates and colors the whole protoplasmic mass; in others the chlorophyl is restricted to specialized masses of protoplasm in the form of bands or stellate bodies. Ordinarily, however, the chlorophyl is restricted to the small lenticular or discoid masses of protoplasm embedded in the cytoplasm, known as the chloroplastids. The chloroplastids, with the aid of light, split up carbon dioxid and water, and with the evolution of some oxygen recombine their elements in a series of stages to produce starch and

other carbohydrate compounds. The chlorophyl pigment may be extracted from the plastids by alcohol and other solvents, and appears when dry as a green resin-like powder. In solution it may be separated into four portions, one of a blue-green color (cyanophyl), the other three of an orange or yellow color (carotin, *α* and *β*, and anthophyl). The change of color in leaves in autumn is due to the breaking up and various transformations of this pigment. In the etiolation or blanching of plants by exclusion of light they lose their color and finally become merged in the protoplasm, from which they are again developed by exposure to light and warmth.

A single long lash-like flagellum is produced from the center of the anterior border, the base of which is embraced by a delicate hyaline, extensile and retractile, collar-like expansion of the body-sarcode. The collar in its extended condition is infundibuliform or wineglass-shaped, and when contracted is subcylindrical or conical, exhibiting in its expanded state a distinct circulating current or cyclosis of its finely granular substance. The ingestive area is discoidal, food-substances being brought in contact with the expanded collar through the vibratory action of the flagellum. They are first carried up the outside and then down the inside of this structure with the circulating sarcode-current, and are finally received into the substance of the body anywhere within the circular area circumscribed by its base. Fecal or waste products are discharged at any point within the same discoidal space. These animalcules have a distinct spheroidal endoplast,

with a contained endoplastule and two or more contractile vesicles, usually conspicuous. In the ruins of Flaviopolis, in Phrygia, has been found a marble block having cylindrical wells marked with the names of different Greek measures. Of these the chœnix appears to have contained 1.5 liters. This seems to have been about the capacity of the Æginetan, Bœotian, and Pontic measures. The Attic chœnix, however, according to various approximative statements of the relation of Attic to Roman measures, must have contained about 1 liter, or half a Babylonian kab; and this is probably the measure mentioned in the New Testament (Rev. vi. 6). In Egypt the Ptolemaic system had a chœnix, which appears to have equaled 0.8 liter. The chœnix of Heraclea in Italy is surmised to have been 0.7 liter.

An element, one of the metals, in the compact form whiter and more lustrous than iron, intensely hard, brittle, and less fusible than platinum. It oxidizes slowly in the air, but burns vividly in oxygen. Hot hydrochloric or sulphuric acid dissolves it; strong nitric acid does not affect it. Chromium does not occur native. It is found in the mineral crocoite or crocoisite (lead chromate), and as a sulphid in daubreelite; it occurs also in some meteoric iron, and the fine green color which makes the emerald valuable is believed to be due to chromium; but the most abundant ore of chromium is chromite or chrome-ironstone. Among its most important compounds are the oxid or sesquioxid (Cr_2O_3), which occurs native in chrome-ocher and chromite. It is a dull-green powder when made artificially by reduction of the chromates, and is used extensively for imparting a green color to porcelain and enamel, and somewhat as a pigment, in the form of oxyhydroxid, under the name of *Guignet's green*. *Potassium bichromate* ($K_2Cr_2O_7$) is the salt from which most salts of chromium are prepared. chromolithography (krō″mō-li-thog′ra-fi), *n.* [< Gr. *χρῶμα*, color, + *lithography*.] A method of producing colored lithographic pictures by the use of a number of prepared lithographic stones. The general outline and the outline of each of the tints in the picture to be reproduced are first traced, and then transferred to the first stone, or keystone, by the ordinary methods of lithography, or the design is drawn directly on the keystone. For the coarser kinds of color-printing the outlines of the design are made upon zinc or aluminium plates with pen or brush, and thence transferred to the stone. From the keystone, which bears the skeleton design, the outlines of each tint are separately transferred to as many other stones as there are colors in the picture. The first impression, taken by the printer from the keystone, gives the outlines of the picture, the second, taken from another stone, all the yellow tints, the third all the reds, and so on until all the colors needed are given. Before each successive impression the sheets are adjusted to a nicety, in order that the colors may not overlap one another. This adjustment is called the *register*. After the printing is completed the sheets are sometimes passed through an embossing-press, to give them a canvas-like surface.

But such an honest *chronicler* as Griffith.
Shak., Hen. VIII., iv. 2.

If it were not that both the *chroniclers* and the statute book assert the novel character of the abuse [collection of benevolences], we might . . . be tempted to doubt whether the charge of innovation brought against Edward IV. were true. *Stubbs*, Const. Hist., § 373.

Cf. *chronograph*.] An inscription in which a certain date or epoch is expressed by the numeral letters contained in it, each letter being counted according to its independent value, as in the motto of a medal struck by Gustavus Adolphus in 1632: "ChrIstVs DVX; ergo trIVMphVs" (C + I + V + D + V + X + I + V + M + V—that is, 100 + 1 + 5 + 500 + 5 + 10 + 1 + 5 + 1000 + 5 = 1632).

There is another near relation of the anagrams and acrostics, which is commonly called a *chronogram*. This kind of wit appears very often on many modern medals, especially those of Germany, when they represent in the inscription the year in which they were coined.
Addison, Spectator, No. 60.

That [motto used] on the occasion of the splendid creation of fourteen serjeants in 1660 was an ingenious *chronogram* alluding to the restoration of Charles II., "aDest CaroLVs MagnVs." *N. and Q.*, 6th ser., X. 30.

★**chronograph** (kron′ō-gràf), *n.* [< Gr. χρονογράφος, recording events (see *chronography*), lit. recording time, < χρόνος, time, + γράφειν, write.] **1.** A chronogram.—**2.** An instrument for recording the exact instant in which an event occurs. The most important instrument of this kind is the astronomical chronograph, the parts of which are: (*a*) a train of clockwork, regulated, not by an ordinary escapement, but in such a way as to move with a continuous and equable motion, and carry forward a sheet or ribbon of paper; (*b*) a pen which draws a continuous line upon the paper, and is so attached to the armature of an electromagnet that whenever the electric current is broken (or made) for an instant a jog is produced in the line drawn by the pen. The electromagnet is put into one circuit with a clock or chronograph which breaks (or makes) the circuit for an instant at every second, or other convenient interval, and also with an observing-key, which on being pressed (at the moment the observation is taken) produces the same effect. The result is that jogs appear upon the line drawn by the pen at every second, and also every time the key is touched; and the relative distances of these jogs, which can be accurately measured, give the time of the observation correct to a fiftieth of a second. The name *chronograph* is also applied to various kinds of watches so contrived that when a button is pressed the second-hand stops, or one of two second-hands stops, or the second-hand leaves a dot of ink upon the dial.

3. An instrument for measuring a small interval of time. The simplest instrument of this description consists of a tuning-fork carrying at the end of one of its prongs a bit of quill, which scratches a wavy line upon a moving piece of blackened paper. At the beginning and at the end of the interval to be measured an induction-spark is made to pass through the paper close to the marking-point. Two little dots are thus made, and the number of waves and fractions of a wave between them gives the interval of time expressed in terms of the period of vibration of the fork as a unit.—**Boulengé's chronograph**, an instrument by means of which a small interval of time is determined by measuring the space described by a falling body during the interval. It is the instrument most used for obtaining initial velocities. Bashforth's chronograph is also used for this purpose.

The marine chronometer differs from the ordinary watch in the principle of its escapement, which is so constructed that the balance is free from the wheels during the greater part of its vibration, and also in being fitted with a compensation adjustment, calculated to prevent the expansion and contraction of the metal by the action of heat and cold from affecting its movements. The balance-spring of the chronometer is helicoidal, that of the watch spiral. The pocket-chronometer does not differ in appearance from a watch, except that it is somewhat larger.

Specifically—**2.** An instrument for measuring the velocity of projectiles. The most general arrangement consists of a series of screens through which a ball is made to pass, the rupture of each screen breaking for a moment the continuity of an electric current, which acts upon the recording strip of a chronograph (which see).—**Hipp's chronoscope**, a time-measuring instrument, consisting of a train of wheels, moved by a weight, with two dials having hands the wheelwork moving which is thrown in and out of gear with the main train by the action of a clutch worked by an electromagnet. The hands, at first stationary, are thrown into gear by the initial event of the period to be measured, and move until, at the final event, they are thrown out of gear and arrested by the clutch. The distance which they have traveled over the dials measures the interval between the two events.

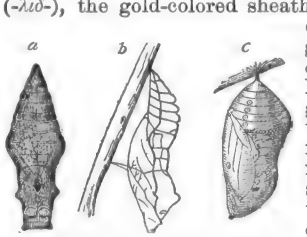
L. *aurelia*, chrysalis, < *aurum*, gold.] A form which butterflies, moths, and most other insects assume when they abandon the larval or caterpillar state and before they arrive at their winged or perfect state; specifically, the pupa of a butterfly. In the chrysalis form the animal is in a state of rest or insensibility, and exists without nutriment for a length of time varying with the species and season. During this period an elaboration is going on in the interior of the chrysalis, giving to the organs of the future animal their proper development before it breaks its envelop.



a, Chrysalis of the Philenor Swallow-tail, shaded back view; *b*, same, lateral outline; *c*, Chrysalis of the Archippus Butterfly, lateral view.

The form of the case of the chrysalis varies with different families and orders. Those of most lepidopterous insects are inclosed in a somewhat horny membranous case, and generally of a more or less angular form, pointed at the abdominal end and sometimes at both ends. Before the caterpillar undergoes its transformation into this state it often spins for itself a silken cocoon, within which the chrysalis is concealed. In most of the *Coleoptera* the legs of the chrysalis are in distinct sheaths; in the *Lepidoptera* they are not distinct; in the locust tribe, and many other insects, the chrysalis resembles the perfect insect, and differs from the latter principally in not having the wings complete. Also called *chrysalid*, *chrysalidan*, *nymph*, *pupa*, and formerly *aurelia*.

'golden flower,' < *χρυσός*, gold, + *ἄνθεμον*, flower.] 1. A plant of the genus *Chrysanthemum*.—2. [*cap.*] [NL.] A large genus of composite plants, chiefly natives of Europe, Asia, and northern Africa. The generic name is now rarely appropriate, as only a small number have yellow flowers. The perennial chrysanthemum of the gardens, *C. Sinense* or *Indicum*, a native of China and Japan, has developed under cultivation a great diversity of handsome and remarkable varieties. It ranks as the national flower of

Chrysanthemum frutescens.

Such a statue was built up upon a wooden core or frame, braced and sustained by rods of metal. When the sculptor had completed his model, the flesh-surface of a cast taken from it was marked off into sections. These were separated from one another, and reproduced in ivory plates, which were eventually fastened on or fitted into the surface of the wooden core. The draperies also were divided into sections and reproduced in gold, gold of different tints often being introduced, and were fitted upon the statue like a garment. The gold portions were sometimes made removable, as in the great statue of Athena by Phidias in the Parthenon at Athens; in that case they were regarded as a reserve fund available to the state in time of need.

The proportions of the whole building [the Parthenon] itself were again adjusted to the scale of the *chryselephantine* statue of Pallas Athene which it contained.

C. T. Newton, Art and Archæol., p. 33.

This is he that was in the *church* in the wilderness with the angel which spake to him in the mount Sina. Acts vii. 38.

[What constitutes a Christian church according to the Scriptures is a question on which Christian denominations widely differ. The three principal views may be distinguished as the Roman Catholic, the Protestant ecclesiastical, and the voluntary. According to Roman Catholic theologians, the church is a visible and organic body, divinely constituted, possessing "Unity, Visibility, Indefectibility, Succession from the Apostles, Universality, and Sanctity" (Faith of Catholics, I. 9), and united to its visible head on earth, the Bishop of Rome. According to the Anglican and Protestant ecclesiastical view, the church of Christ is "a permanent visible society" (*Wordsworth* on Mat. xvi. 18), divinely compacted, governed, and equipped, and having definite ends, a definite policy, and a historic continuity. (The Church Cyc.) According to the voluntary conception, a church is a society of persons professing faith in the Lord Jesus Christ as the Son of God and the Saviour of men, and organized in allegiance to him for Christian work and worship, including the administration of the sacraments which he has appointed. (*R. W. Dale*, Manual of Congr. Principles, Comp. West. Conf., xxxv.; Thirty-nine Art., xix.) The second view is held by many, perhaps a majority, in the Episcopal, Lutheran, and other hierarchical denominations; the last by a majority of those in the non-hierarchical denominations, including the Methodist, Baptist, Presbyterian, and Congregational.]—**Advocate of the church.** See *advocate.*—**Anglican Church, Broad Church.** See the adjectives.—**Church militant,** the church on earth, as engaged in a warfare with the world, the flesh, and the devil, or the combined powers of temptation and unrighteousness: in distinction from the *church triumphant* in heaven.—**Church of England,** the national and established church in England; the Anglican Church in England and the British colonies, in some of which it has been disestablished. The Church of England claims continuity with that branch of the Catholic Church which existed in England before the Reformation. In the first half of the sixteenth century, under Henry VIII., the spiritual supremacy and jurisdiction of the Pope were abolished; the sovereign was declared to be the head of the church in a sense explained in the thirty-seventh of the Thirty-nine Articles; and a close union of church and state, known as the establishment of the church, took place. The clergy of the Church of England are composed of three orders, namely, bishops, who are appointed by the crown (see *congé d'élire*, under *congé*), priests or presbyters, and deacons. There are also two archbishops, the Archbishop of Canterbury and the Archbishop of York, the former being the primate of England. Twenty-four of the bishops and the two archbishops sit and vote in the House of Lords. Its chief ecclesiastical body is the Convocation. Thus, the Episcopal Church is established in England and Wales, the Presbyterian in Scotland, the Evangelical in Prussia, the Roman Catholic in Italy, Spain, Portugal, etc. In some countries of Europe, as France, all or many of the principal religious organizations receive state support. In the United States the church is entirely dissevered from all relations to the state. —**Fathers of the church.** See *father.*—**Free Church, Gallican Church, High Church.** See the adjectives.—**Independent Evangelical Church of Neuchâtel,** a free evangelical church organized in 1873 in the canton of Neuchâtel, Switzerland. For the *church-ale* two young men of the parish are yearly chosen by their last foregoers to be wardens, who, dividing the task, make collection among the parishioners of whatsoever provision it pleaseth them voluntarily to

Its uses were varied; indeed, it would seem to have been the public room of the parish, which could, with the consent of the churchwardens, be used for any purpose that the needs of the parish rendered necessary. There are usually two churchwardens to each parish, but by custom there may be only one. In some cases the parish has a right by custom to choose both. In the United States churchwardens are always elected, but have duties similar to the above. Ciliata (sil-i-ā'tä), *n. pl.* [NL., neut. pl. of *ciliatus*, having cilia: see *ciliate*.] **1.** The ciliated infusorians; a major group of *Infusoria*, as distinguished from the *Flagellata* and the *Tentaculifera*, characterized by the possession of organs of locomotion and prehension in the shape of numerous vibratile cilia, more or less completely clothing the body. The cilia are variously modified as setæ, styles, or uncini, and membraniform expansions are occasionally found; but the *Ciliata* are devoid of the special supplementary lash-like appendages called flagella. They are usually unsymmetrical animals of a high grade of organization in their class, the simplest of them being differentiated into an endosarc and ectosarc with an endoplastule and contractile vacuole, while most, if not all, show an oral region where food is ingested, whence an esophageal depression leads into the endosarc; and there is also, usually, an aboral or anal area through which the refuse of digestion is evacuated. The families are numerous, and have been divided by Stein into the groups *Holotricha*, *Heterotricha*, *Hypotricha*, and *Peritricha*, according to the character of the cilia and their disposition upon the body of the animal. *Paramecium* and *Vorticella* are common examples of the *Ciliata*.

In such cases the cilia have in the individual cells precisely the same action as in the numberless microscopic animals of which they are highly characteristic, as infusorians, radiolarians, polyzoans, rotifers, and the embryonic or larval stages of very many other invertebrates. Cilia are distinguished by their permanency from the various temporary processes which resemble them, such as pseudopodia, and by their minuteness and activity from the similar but usually larger special processes known as flagella, vibracula, etc.; but the distinction is not absolute. The peculiar vibratile action of cilia is termed *ciliary motion*. See cuts under *blastocœle*, *Paramecium*, and *Vorticella*.

Of these the most abundant and the one in most common use is quinine. Others equally valuable are quinadin, cinchonine, and cinchonidine. The amount of alkaloids yielded by the bark is very variable, from a very small percentage to as much as 12 per cent., of which from one third to three fourths is quinine. **2.** [*l. c.*] The medicinal bark of the species of *Cinchona.*—**African cinchona,** the bark of species of the rubiaceous genus *Sarcocephalus*, from western Africa.
